

Process & Decision Documentation

Side Quest 5

The change I made was to add a reflective/meditative camera experience. I used lerp to create a slow-paced experience.

Role-Based Process Evidence

In world.json, I updated the player's starting position so it would match up with the obstacles. In sketch.js, I added lerp to the camX and camY to create a smoother flow that follows the player, enhancing the reflective/meditative camera experience. Once added, I compared the old camX and camY by checking the live server to see if there was a difference in the camera movement. In total, I made 5 commits.

```
// Center camera on player, then clamp to legal camera range.  
camX = lerp(camX, constrain(player.x - width / 2, 0, maxCamX), 0.02);  
camY = lerp(camY, constrain(player.y - height / 2, 0, maxCamY), 0.02);
```

Entry Header

Name: Katrina

Role(s): Camera Designer

Primary responsibility for this work: Add camera movement

Goal of Work Session

I wanted to accomplish adding a smooth flow to show a meditative camera experience.

GenAI Documentation

No GenAI was used for this task.

Decision Points & Trade-offs

Tried different lerp value amounts to see which amount would best show a reflective camera experience.

Verification & Judgement

- Playtesting
